Babtec.QC
The Quality Cockpit for your KPIs

Performance indicators are essential tools for control within a company. They enable **clear assessment** of performance and focus attention on uncovering risks and opportunities. On top of that, they help with **clearly specifying measurable targets** and successfully implementing those targets. Decision-makers can quickly use the bundled information for further strategic planning and to increase awareness of **critical indicators** within the company.

The Quality Cockpit from Babtec delivers the most important performance indicators right to your computer screen. The tool is a central instrument for the **clear representation of performance indicators**. You receive information about the quality of your processes and products networked through a central location automatically and in real time, all evaluated according to your specifications and marked with **easy-to-understand traffic signal colors**.

Uncover risks early on or demonstrate the performance capability of your processes to your customers, auditors and internal persons in charge. You no longer have to spend countless hours searching for individual analyses and for certain reports buried deep in the system. The Quality Cockpit always presents you only with the information that is relevant to you.

Defining individual performance indicators

In the Quality Cockpit, relevant performance indicators are provided **specifically oriented to target groups**, matching every employee and his area of responsibility. All of the decision-related information is available to everyone, regardless of whether the person is a quality manager, internal auditor or managing director.

Convenient **drill-down functions** enable an intuitive navigation. For analyzing the performance indicators, the processes for increasing the data's level of detail and, if necessary, accessing the data source are just a few clicks away.

Quality Cockpit from Babtec ensures you can keep an eye on all of the relevant performance indicators at all times

Integrating external data sources

External data sources can also be integrated into Quality Cockpit without any problems. As such, access to other data, such as information from ERP systems, Excel files and other databases, is also possible. Besides typical **quality performance indicators**, you can also generate **financial performance indicators** or evaluate employee and customer satisfaction.

Flexible assessment processes

A performance indicator can be defined individually based on **company-specific requirements**, i.e., which data should be included as well as which time period and the criteria that should be applied to the assessment. You decide on the performance indicators that will be used to monitor the performance of your company.

When you set up the **performance indicator system**, a large selection of predefined database queries and filters can be accessed that are easily put together, similar to a **modular system**. Suitable **schedules** ensure that the performance indicators are automatically calculated and updated – and all of that demand-oriented, e.g. hourly, daily or monthly.

Babtec.QC
At a Glance

– Cockpit for monitoring the quality of products and processes across divisions

– Transparency through the assessment via key performance indicators (KPI) – automatically and in real time

– Individual definition of the Quality Cockpit for different target groups, such as quality managers, managers or employees as well as auditors and customers
  > Visualization of the performance indicators using distinct traffic light status
  > Convenient drill-down functions
  > Details with the push of a button (e.g. complaints that are the basis of a performance indicator)

– Flexible performance indicator definition for a variable or attributive assessment, with individual point systems

– Intuitive modular system for the definition of performance indicators (Babtec.QC/Suite)
  > Access to predefined queries, filters and formulas

– Schedules for calculating and automatically updating performance indicators

– Manual updating of performance indicators (on-demand calculation)

– Determining performance indicators based on all BabtecQ modules as well as external data sources (e.g. ERP systems, Excel)
